

Secure Code Review - CodeAlpha Internship Task

Introduction

Secure code review is the process of examining source code to identify security vulnerabilities and improve software security.

Sample Code Reviewed

```
username = input("Enter username:") password = input("Enter password:")
if username == "admin" and password == "12345": print("Login Successful") else:
print("Login Failed")
```

Security Issues Identified

1. **Hardcoded Credentials** The username and password are stored directly in the source code.
2. **Weak Password** The password "12345" is very weak and can be guessed easily.
3. **No Password Encryption** Passwords are stored in plain text.
4. **No Input Validation** User input is not validated before processing.

Recommendations

- Use strong passwords.
- Store passwords using hashing.
- Avoid hardcoded credentials.
- Validate user input.
- Follow secure coding practices.

Conclusion

The reviewed code contains several security weaknesses. Applying secure coding techniques can improve application security and protect sensitive data.
